LAB-6

AIM: Demonstration of Webserver and DNS using Packet Tracer.

Topology:

Procedure:

- Set the IP Address and Subnet mask of the PC and Server accordingly. From the PC invoke the web browser in the desktop tab and give the IP of the server. ^{http://10.0.0.2} See that a home page gets displayed.
- Now go to services of services tab in the properties of the server, click on HTTP. The following window is seen. Click on the edit button of index.html and change text from CISCO to BMSC. Save to overwrite. View the same as above from the PC to see the modified page.

Domain Name System:

- To activate DNS, click on DNS service. Select on. Enter the name and IP. Click on Add button.
- As the name is fixed for the IP address, check the same by giving IP address in the web browser window of the PC. ^{http://csebmssc}
- Make your own HTML page with a table displaying any details. Connect same with the hyperlink ^{http://csebmssc/keerthana.html} View the same from PC.

Results: The html file: Keerthana.html

```
<html>
<head>
Hello
</head>
<body>
<p> This is Keerthana </p>
</body>
</html>
```

Output: Url: http://csebmisce/Keerthana.html

Hello
This is Keerthana

Observations:

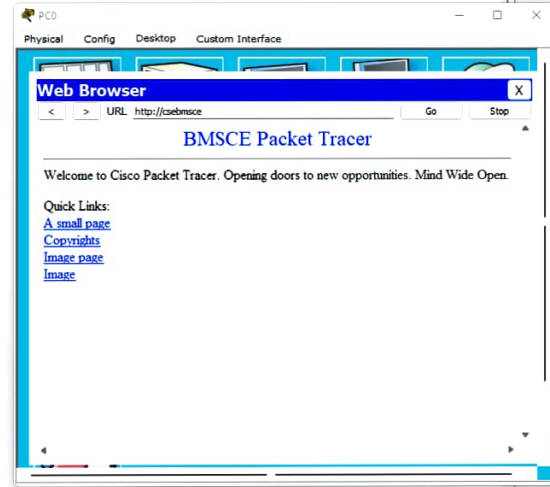

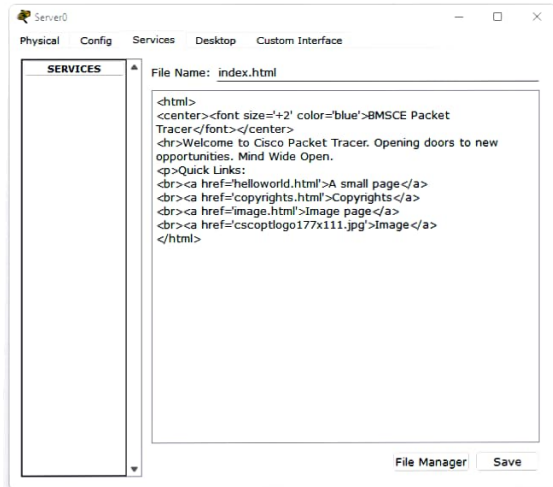

Learning outcome: DNS protocol helps to map a name with an IP address. This protocol is very useful because the users are comfortable with the names and the computers are comfortable with the IP address.

Now go to services of services top in the properties of the server, click on HTTP, the following window is seen. Click on the edit button of index.html and change text from Cisco to BRUCE. Save to overwrite. View the same as above from the PC to see the modified page.

Domain Name System:

To activate DNS, click on DNS service. Select on. Enter the name and IP address. As the name is fixed for the IP address, test the server by giving IP address in the web browser window of the PC.

Make your own HTML page with a table displaying only details. Connect same with the web browser and the same browser.
